

Michael Strickland

Profile

Getting into software development has been an amazing journey. Since developing my very first project, I knew this was the career path for me and I was eager to learn more. Software development comes with many challenges and new opportunities to learn which specifically interests me.

The day to day of always learning and overcoming new challenges is something that makes me so very excited about really diving into this industry. What started with me just reading a simple book on JavaScript has now turned into a full-on passion and I can't wait to see where it takes me.

Experience

ReactJS web application // University of Denver (2019 > Present)

This Beach Resort app is a full MERN application that uses front-end and back-end technology. I used React.js, Bootstrap, css, and Javascript for the front-end, and used JSK, JavaScript, Contentful, NPM, Git, and Netlify for the back-end. This application is hosted using Netlify, and GitHub. Link to project- <https://michaeladamstrickland.github.io/Portfolio/>

Bootcamp Project "The Office" // University of Denver (2019 > Present)

This is a fun and entertaining web application about the beloved TV series "The Office". By using bootstrap to style the front-end, and jQuery, and JavaScript to format and call back-end content. I used the Giphy api to generate gifs, and the YouTube api to call video clips to the page. This app creates a great way to enjoy an ageless show in a new way.

Bootcamp Project "Inventory app" // University of Denver (2019 > Present)

With this application I worked on building a full front, and back-end web application that can handle multiple distributors and retailers inventory needs. I used Bulma and SaSS to style the front-end. I brought in Handlebars, Sequelize, JavaScript, and a Chat.io for the Back-end. With this app you can add, save, or delete items from a inventory database and manipulate the displayed data.
