MICHAEL STRICKLAND

Full Stack Web Developer

BIO

Getting into software development has been an amazing journey. Since developing my very first project, I knew this was the career path for me and I was eager to learn more. Software development comes with many challenges and new opportunities to learn which specifically interests me.

The day to day of always learning and overcoming new challenges is something that makes me so very excited about really diving into this industry. what started with me just reading a simple book on JavaScript has now turned into a full-on passion and I cant wait to see where it takes me.

University of Denver
April – Aug
Full Stack Web Development Certificate

WORK EXPERIENCE

Jay Ablah Photography   Web Developer
July–Current

While working with this great photographer I have been helping him rebuild his website by starting from scratch. I have used front-end from works to build out the new look. The back-end is done with JavaScript, MySQL, jQuery, and Passport. The site is still being worked on and will be launched using GoDayddy. This has been my first full fledge client web site.

Bootcamp Project "The Office Fan Page"
May–2019

This is a fun and entertaining web application about the beloved TV series "The Office". By using bootstrap to style the front-end, and jQuery, and JavaScript to format and call back-end content. I used the Giphy api to generate gifs, and the YouTube api to call video clips to the page. This app creates a great was to enjoy an ageless show in a new way.

Bootcamp Project "Inventory Management app"
July-2019

With this app my group and I worked on building a full on front and back app that can handle multiple distributors and retailers inventory needs. We used Bulma and SaSS to style the front-end, and brought in Handlebars, Sequelize, JavaScript, and a Chat.Io for the Back-end With this we could add save or delete items from an inventor database and manipulate the displayed data to reflect with customers needs.

Bootcamp Project "Bamazon'
June-2019

Bamazon is a NodeJs app that replicates an "amazon" type point of sale. This app takes saved database information from MySQL and displays it in the terminal. With this app you can buy or sell product stored in the database and show the inventory difference in real time.
